

			GOAL					Select the best candidate for my MVPS						
									Montly cost = cost per day x 30					
									Cost per day = Price / delivery time	Revision cost = Price / revisions			Control over the experience: Ratio between delivery days/Revisions < infinity = 0; 1= full control	
					Skills = meet the criteria requirement for the MVPS and mintylabs strategy	Productivity Potential: Orders completed *Revisions / delivery time	Customer Satisfaction = Review count divided by the numbers of orders completed consider (subtracting the negative reviews first?)		Cost per hour = price / (delivery time / 24)	Affordability = Divide price per maximum price in the data set			If Revisions = 1 I have 1 command/cons ultation under my control	
					Orders completed	Productivity			money	time		Customer feedback = Review score	Revisions	Average response rate
			Criteria			Experience			Cost				Charisma
